Manifold-valued Signal & Image Processing

Tasks in **image processing** are often phrased as an optimisation problem. **Here.** The pixel take values on a manifold

- ▶ phase-valued data (\mathbb{S}^1)
- ▶ wind-fields, GPS (\mathbb{S}^2)
- ▶ DT-MRI ($\mathcal{P}(3)$)
- ▶ EBSD, (grain) orientations ($SO(n)$)

Artificial noisy phase-valued data.

Tasks. Denoising, Inpainting, labeling (classification), deblurring,...

A d -dimensional Riemannian manifold \mathcal{M}

Notation.

- ▶ Geodesic $\gamma(\cdot; p, q)$
- ▶ Tangent space $\mathcal{T}_p\mathcal{M}$
- ▶ inner product $(\cdot, \cdot)_p$
- ▶ Logarithmic map $\log_p q = \dot{\gamma}(0; p, q)$
- ▶ Exponential map $\exp_p X = \gamma_{p,X}(1)$
where $\gamma_{p,X}(0) = p$ and $\dot{\gamma}_{p,X}(0) = X$
- ▶ Parallel transport $P_{q \leftarrow p} Y$ "move"
tangent vectors from $\mathcal{T}_p\mathcal{M}$ to $\mathcal{T}_q\mathcal{M}$

The Model

We consider a minimization problem

$$\arg \min_{p \in \mathcal{C}} F(p) + G(\Lambda(p))$$

- ▶ \mathcal{M}, \mathcal{N} are (high-dimensional) Riemannian Manifolds
- ▶ $F: \mathcal{M} \rightarrow \overline{\mathbb{R}}$ nonsmooth, (locally, geodesically) convex
- ▶ $G: \mathcal{N} \rightarrow \overline{\mathbb{R}}$ nonsmooth, (locally) convex
- ▶ $\Lambda: \mathcal{M} \rightarrow \mathcal{N}$ nonlinear
- ▶ $\mathcal{C} \subset \mathcal{M}$ strongly geodesically convex.

In image processing.

choose a model, such that finding a minimizer yields the reconstruction

Splitting Methods & Algorithms

On a Riemannian manifold \mathcal{M} we have

- ▶ Cyclic Proximal Point Algorithm (CPPA) [Bačák 2014]
- ▶ (parallel) Douglas–Rachford Algorithm (PDRA) [RB, Persch, and Steidl 2016]

On \mathbb{R}^n PDRA is known to be equivalent to [Setzer 2011; O'Connor and Vandenberghe 2018]

- ▶ Primal-Dual Hybrid Gradient Algorithm (PDHGA) [Esser, Zhang, and Chan 2010]
- ▶ Chambolle-Pock Algorithm (CPA) [Chambolle and Pock 2011; Pock, Cremers, Bischof, and Chambolle 2009]

But on a Riemannian manifold \mathcal{M} :  no duality theory!

Goals of this talk.

Formulate Duality on a Manifold

Derive a Riemannian Chambolle–Pock Algorithm (RCPA)

The Euclidean Fenchel Conjugate

Let $f: \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$ be proper and convex.

We define the **Fenchel conjugate** $f^*: \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$ of f by

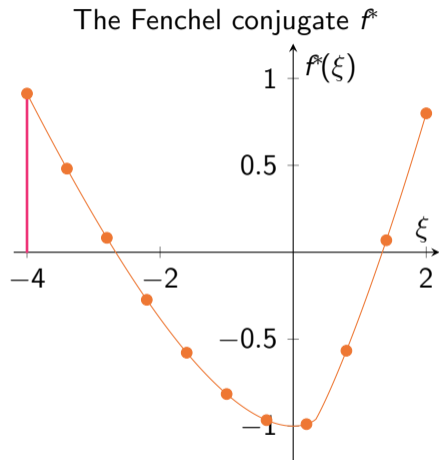

$$f^*(\xi) := \sup_{x \in \mathbb{R}^n} \langle \xi, x \rangle - f(x) = \sup_{x \in \mathbb{R}^n} \begin{pmatrix} \xi \\ -1 \end{pmatrix}^T \begin{pmatrix} x \\ f(x) \end{pmatrix}$$

- ▶ interpretation: maximize the distance of $\xi^T x$ to f
- ⇒ extremum seeking problem on the epigraph

The Fenchel **biconjugate** reads

$$f^{**}(x) = (f^*)^*(x) = \sup_{\xi \in \mathbb{R}^n} \langle \xi, x \rangle - f^*(\xi).$$

Illustration of the Fenchel Conjugate

Properties of the Euclidean Fenchel Conjugate

[Rockafellar 1970]

- ▶ The Fenchel conjugate f^* is **convex** (even if f is not)
- ▶ f^{**} is the largest convex, lsc function with $f^{**} \leq f$
- ▶ If $f(x) \leq g(x)$ holds for all $x \in \mathbb{R}^n$ then $f^*(\xi) \geq g^*(\xi)$ holds for all $\xi \in \mathbb{R}^n$
- ▶ **Fenchel–Moreau theorem**: f convex, proper, lsc $\Rightarrow f^{**} = f$.
- ▶ **Fenchel–Young inequality**:

$$f(x) + f^*(\xi) \geq \xi^T x \quad \text{for all } x, \xi \in \mathbb{R}^n$$

- ▶ For a proper, convex function f

$$\xi \in \partial f(x) \Leftrightarrow f(x) + f^*(\xi) = \xi^T x$$

- ▶ For a proper, convex, lsc function f , then

$$\xi \in \partial f(x) \Leftrightarrow x \in \partial f^*(\xi)$$

The Riemannian m -Fenchel Conjugate

[RB, Herzog, Silva Louzeiro, Tenbrinck, and Vidal-Núñez 2021]

alternative approaches: [Ahmadi Kakavandi and Amini 2010; Silva Louzeiro, RB, and Herzog 2022]

Idea: Introduce a point on \mathcal{M} to “act as” 0.

Let $m \in \mathcal{C} \subset \mathcal{M}$ be given and $F: \mathcal{C} \rightarrow \overline{\mathbb{R}}$.

The m -Fenchel conjugate $F_m^*: \mathcal{T}_m^* \mathcal{M} \rightarrow \overline{\mathbb{R}}$ is defined by

$$F_m^*(\xi_m) := \sup_{X \in \mathcal{L}_{\mathcal{C}, m}} \{ \langle \xi_m, X \rangle - F(\exp_m X) \},$$

where $\mathcal{L}_{\mathcal{C}, m} := \{ X \in \mathcal{T}_m \mathcal{M} \mid q = \exp_m X \in \mathcal{C} \text{ and } \|X\|_p = d(q, p) \}$.

Let $m' \in \mathcal{C}$. The mm' -Fenchel-biconjugate $F_{mm'}^{**}: \mathcal{C} \rightarrow \overline{\mathbb{R}}$ is given by

$$F_{mm'}^{**}(p) = \sup_{\xi_{m'} \in \mathcal{T}_{m'}^* \mathcal{M}} \{ \langle \xi_{m'}, \log_{m'} p \rangle - F_m^*(P_{m \leftarrow m'} \xi_{m'}) \}.$$

usually we only use the case $m = m'$.

Properties of the m -Fenchel Conjugate

[RB, Herzog, Silva Louzeiro, Tenbrinck, and Vidal-Núñez 2021]

- ▶ F_m^* is convex on $\mathcal{T}_m^*\mathcal{M}$
- ▶ $F(p) \leq G(p)$ holds for all $p \in \mathcal{C} \Rightarrow F_m^*(\xi_m) \geq G_m^*(\xi_m)$ holds for all $\xi_m \in \mathcal{T}_m^*\mathcal{M}$
- ▶ Fenchel-Moreau theorem: $F \circ \exp_m$ convex (on $\mathcal{T}_m\mathcal{M}$), proper, lsc, then $F_{mm}^{**} = F$ on \mathcal{C} .
- ▶ Fenchel-Young inequality: For a proper, convex function $F \circ \exp_m$

$$\xi_p \in \partial_{\mathcal{M}} F(p) \Leftrightarrow F(p) + F_m^*(P_{m \leftarrow p} \xi_p) = \langle P_{m \leftarrow p} \xi_p, \log_m p \rangle.$$

- ▶ For a proper, convex, lsc function $F \circ \exp_m$

$$\xi_p \in \partial_{\mathcal{M}} F(p) \Leftrightarrow \log_m p \in \partial F_m^*(P_{m \leftarrow p} \xi_p).$$

Proximal Map

For $F: \mathcal{M} \rightarrow \overline{\mathbb{R}}$ and $\lambda > 0$ we define the **Proximal Map** as
[Moreau 1965; Rockafellar 1970; Ferreira and Oliveira 2002]

$$\text{prox}_{\lambda F} p := \arg \min_{u \in \mathcal{M}} d(u, p)^2 + \lambda F(u).$$

- ! For a Minimizer u^* of F we have $\text{prox}_{\lambda F} u^* = u^*$.
- ▶ For F proper, convex, lsc:
 - ▶ the proximal map is unique.
 - ▶ **Proximal-Point-Algorithm:**
 $x_k = \text{prox}_{\lambda F} x_{k-1}$ converges to $\arg \min F$
- ▶ $q = \text{prox}_{\lambda F} p$ is equivalent to

$$\frac{1}{\lambda} (\log_q p)^b \in \partial_{\mathcal{M}} F(q)$$

The Exact Riemannian Chambolle–Pock Algorithm (eRCPA)

[RB, Herzog, Silva Louzeiro, Tenbrinck, and Vidal-Núñez 2021]

Input: $m, p^{(0)} \in \mathbb{R}^d$, $n = \Lambda(m)$, $\xi_n^{(0)} \in \mathbb{R}^d$, and parameters $\sigma, \tau, \theta > 0$

1: $k \leftarrow 0$

2: $\bar{p}^{(0)} \leftarrow p^{(0)}$

3: **while** not converged **do**

4: $\xi_n^{(k+1)} \leftarrow \text{prox}_{\tau G_n^*}(\xi_n^{(k)} + \tau(\log_n \Lambda(\bar{p}^{(k)}))^b)$

5: $p^{(k+1)} \leftarrow \text{prox}_{\sigma F} \left(p^{(k)} + P_{p^{(k)} \leftarrow m} \left(-\sigma D\Lambda(m)^* [\xi_n^{(k+1)}]^\# \right) \right)$

6: $\bar{p}^{(k+1)} \leftarrow p^{(k+1)} + \theta(p^{(k+1)} - p^{(k)})$

7: $k \leftarrow k + 1$

8: **end while**

Output: $p^{(k)}$

Generalizations & Variants of the RCPA

Classically

[Chambolle and Pock 2011]

- ▶ change $\sigma = \sigma_k, \tau = \tau_k, \theta = \theta_k$ during the iterations
- ▶ introduce an acceleration γ
- ▶ relax dual $\bar{\xi}$ instead of primal \bar{p} (switches lines 4 and 5)

Furthermore we

[RB, Herzog, Silva Louzeiro, Tenbrinck, and Vidal-Núñez 2021]

- ▶ introduce the **IRCPA**: linearize Λ , i. e., adopt the Euclidean case from

[Valkonen 2014]

$$\log_n \Lambda(\bar{p}^{(k)}) \rightarrow P_{n \leftarrow \Lambda(m)} D\Lambda(m) [\log_m \bar{p}^{(k)}]$$

- ▶ choose $n \neq \Lambda(m)$ introduces a parallel transport

$$D\Lambda(m)^* [\xi_n^{(k+1)}] \rightarrow D\Lambda(m)^* [P_{\Lambda(m) \leftarrow n} \xi_n^{(k+1)}]$$

- ▶ change $m = m^{(k)}, n = n^{(k)}$ during the iterations

Manopt.jl: Optimisation on Manifolds in Julia

Goal. Provide optimisation algorithms on [Riemannian manifolds](#), i. e. based on [ManifoldsBase.jl](#) such that it can be used with all manifolds from [Manifolds.jl](#).

Features.

- ▶ generic algorithm framework:
With `Problem P` and `Options O`
 - ▶ `initialize_solver!(P,O)`
 - ▶ `step_solver!(P, O, i)`: *i*th step
- ➡ run algorithm: call `solve(P,O)`
- ▶ generic debug and recording
- ▶ step sizes and stopping criteria.

Manopt Family.

-  manoptjl.org [RB 2022]
-  manopt.org [Boumal, Mishra, Absil, and Sepulchre 2014]
-  pymanopt.org [Townsend, Koep, and Weichwald 2016]

Algorithms.

- ▶ Gradient Descent
CG, Stochastic, Momentum, ...
- ▶ Quasi-Newton
BFGS, DFP, Broyden, SR1, ...
- ▶ Nelder-Mead, Particle Swarm
- ▶ Subgradient Method
- ▶ Trust Regions
- ▶ Chambolle-Pock
- ▶ Douglas-Rachford
- ▶ Cyclic Proximal Point

The ℓ^2 -TV Model

[Rudin, Osher, and Fatemi 1992; Lellmann, Strekalovskiy, Koetter, and Cremers 2013; Weinmann, Demaret, and Storath 2014]

For a manifold-valued image $f \in \mathcal{M}$, $\mathcal{M} = \mathcal{N}^{d_1, d_2}$, we compute

$$\arg \min_{p \in \mathcal{M}} \frac{1}{\alpha} F(p) + G(\Lambda(p)), \quad \alpha > 0,$$

with

- ▶ data term $F(p) = \frac{1}{2} d_{\mathcal{M}}^2(p, f)$
- ▶ “forward differences” $\Lambda: \mathcal{M} \rightarrow (T\mathcal{M})^{d_1-1, d_2-1, 2}$,

$$p \mapsto \Lambda(p) = \left((\log_{p_i} p_{i+e_1}, \log_{p_i} p_{i+e_2}) \right)_{i \in \{1, \dots, d_1-1\} \times \{1, \dots, d_2-1\}}$$

- ▶ prior $G(X) = \|X\|_{g, q, 1}$ similar to a collaborative TV [Duran, Moeller, Sbert, and Cremers 2016]
- ⇒ $\text{prox}_{\lambda G_n^*}$ given in closed form for $q = 1$ (anisotropic TV) and $q = 2$ (isotropic TV).

Numerical Example for a $\mathcal{P}(3)$ -valued Image

$\mathcal{P}(3)$ -valued data.

anisotropic TV, $\alpha = 6$.

- ▶ in each **pixel** we have a symmetric positive definite matrix
- ▶ Applications: denoising/inpainting e.g. of DT-MRI data

Numerical Example for a $\mathcal{P}(3)$ -valued Image

$\mathcal{P}(3)$ -valued data.

anisotropic TV, $\alpha = 6$.

Approach. CPPA as benchmark [Bačák 2014; RB, Herzog, Silva Louzeiro, Tenbrinck, and Vidal-Núñez 2021]

	CPPA	PDRA	IRCPA
parameters	$\lambda_k = \frac{4}{k}$	$\lambda = 0.58$ $\beta = 0.93$	$\sigma = \tau = 0.4$ $\gamma = 0.2, m = l$
iterations	4000	122	113
runtime	1235 s.	380 s.	96.1 s.

Numerical Example for a $\mathcal{P}(3)$ -valued Image

Approach. CPPA as benchmark [Bačák 2014; RB, Herzog, Silva Louzeiro, Tenbrinck, and Vidal-Núñez 2021]

	CPPA	PDRA	IRCPA
parameters	$\lambda_k = \frac{4}{k}$	$\lambda = 0.58$ $\beta = 0.93$	$\sigma = \tau = 0.4$ $\gamma = 0.2, m = l$
iterations	4000	122	113

Summary

Summary.

- ▶ We introduced a duality framework on manifolds
- ▶ we introduced a Riemannian Chambolle–Pock algorithm
- ▶ We saw a Software framework for Optimisation algorithms on manifolds
- ▶ Numerical examples illustrates its performance

Further.

- ▶ A Fenchel Conjugate can be defined on $T\mathcal{M}$
⇒ (hyperplane) separation Theorem
- ▶ Extended to semi-smooth Newton

[RB, Herzog, and Silva Louzeiro 2021]

[Diepeveen and Lellmann 2021]

Outlook.

- ▶ Strategies for choosing base points, investigate $C(k)$
- ▶ Investigate constraint optimisation on Manifolds
- ▶ look into further applications
